2003

6.1

NETWORKS, LARGE AND SMALL (LAN, MAN, WAN)

©Brooks/Cole,
2003

OBJECTIVES

After reading this chapter, the reader should be able to:

- Understand the rationale for the existence of networks.
- Distinguish between the three types of networks: LANs, MANs, and WANs.
- Understand the OSI model and TCP/IP.
- List different connecting devices and the OSI layers in which each device operates.
- Understand client-server models.

©Brooks/Cole,
2003

Terminologies

- Computer network:
 - Combination of systems through transmission media.
- According to the spanning area of the network:
 - LAN: Local Area Network
 - MAN: Metropolitan Area Network
 - WAN: Wide Area Network
- Connecting the networks using the connecting devices: internet.

©Brooks/Cole,
2003

6.2

OSI MODEL

OSI Model

- A frame work of seven layers that suggests the functionality of each separate but related layer.
- Not all devices need to implement all the layers.
 - depends on the location and the functionalities.

Note:

The Open Systems Interconnection model (OSI model) is a theoretical model that shows how any two different systems can communicate with each other.

Figure 6-1

The OSI model

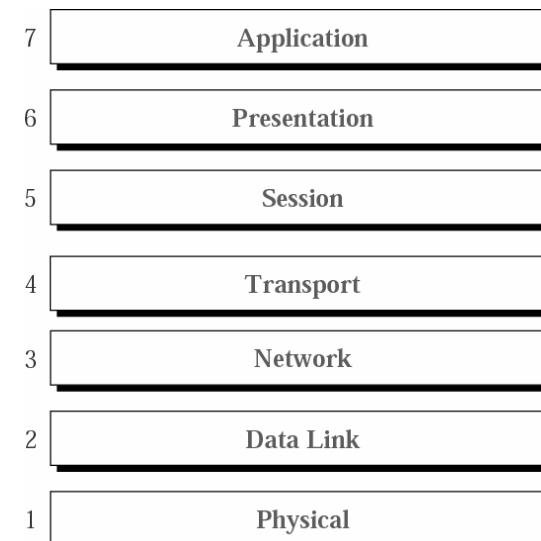

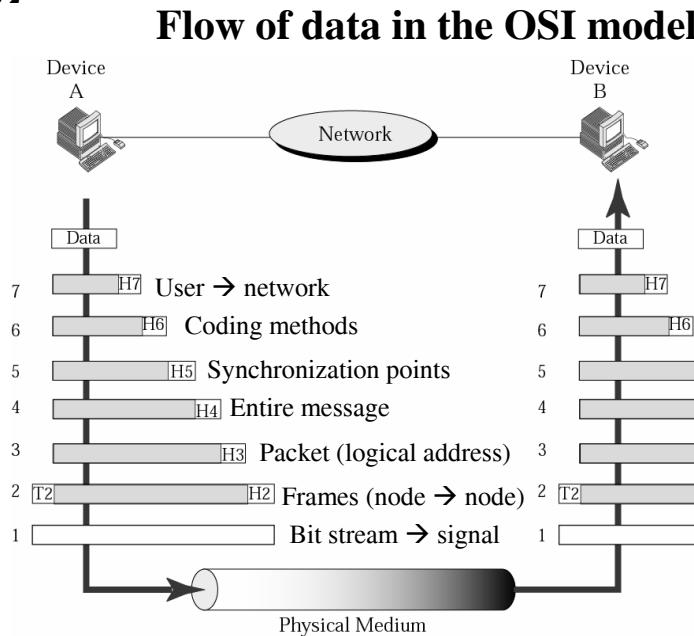

Figure 6-2

Sending Data from Device A to B

- (At A) Data move down until they reach the physical layer.
 - Control information is added as header or trailer at each node.
- (At B) Data move up until they reach the application layer.
- Data may pass through intermediate nodes that only involves the first three layers of OSI model.

©Brooks/Cole,
2003

Functionalities of the Layers

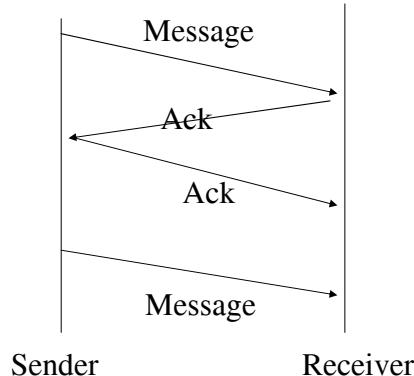

- Physical layer:
 - Transmitting a bit stream over a physical medium.
 - Encode-> Group of bits->signal-> physical medium.
- Data link layer:
 - Organize data into units called frame.
 - Responsible for node-to-node delivery.
 - Headers and trailers contain:
 - Addresses of two adjacent stations (senders and receivers)
 - Error correction or detection codes.

Functionalities of the Layers

- Network Layer:
 - Delivery of a packet (data units handled by network layer)
 - From source to destination
 - Add source and destination addresses to the header.
 - Called IP address (or logical address)
 - IP address should be unique => 140.112.29.21
- Transport layer:
 - Delivery of the entire message
 - A message is composed of packets.
 - Packets might be lost or might arrive out of order.
 - Resend lost packets and reorganize the packets.

Functionalities of the Layers

- Session layer:
 - Control dialog between users.
 - Decompose a long message into smaller one.
 - Add synchronization points for backup delivery.
 - When message lost due to network failure, the sender resend the message after the synchronization point.

Functionalities of the Layers

- Presentation layer:
 - Concerned with the format and semantics of information. => Like ASCII to Unicode
 - Data compression and decompression
 - Data encryption and decryption
- Application layer:
 - Enable user (human or software) to access network.

Handout

Layer			
Application			Enable user to access network
Presentation			Concerned data format and semantics
Session		dialog	synchronization point.
Transport	Source-to-destination	Message	Resend and reorganize the packets
Network	Source-to-destination	Packet	Use IP address
Data link	Node-to-Node	Frame	Error correction or detection codes.
Physical	Physical Medium	Group of bits	Transmitting a bit stream over a physical medium

6.3

CATEGORIES OF NETWORKS

Figure 6-4

Three Examples of LANs

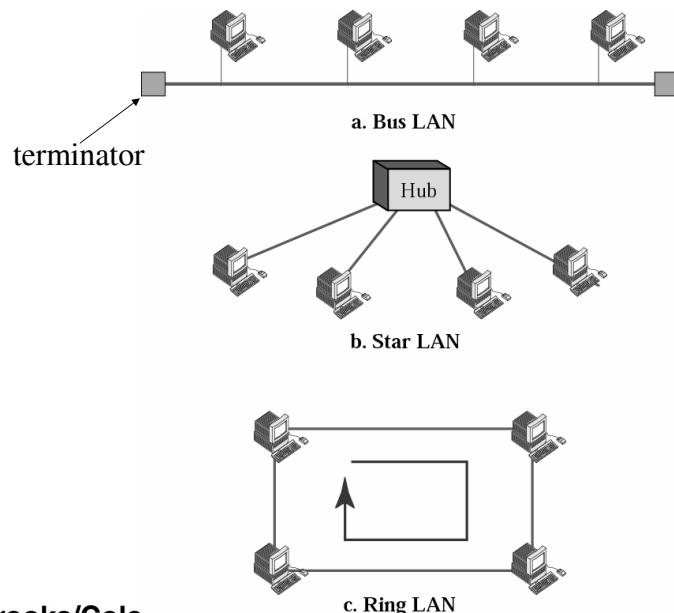

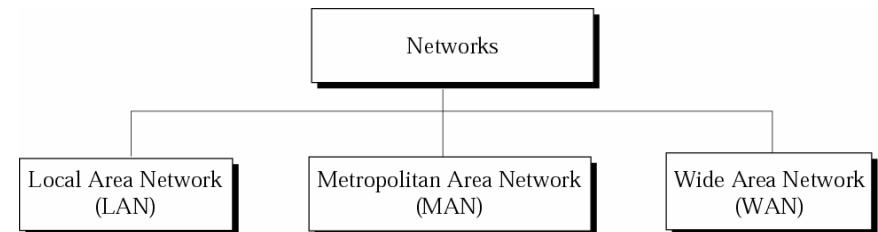

Figure 6-3

Categories of networks

BUS topology

- Computer are connected through a common medium called bus.
- All computers receive the frames and check destinations.
- Use cable terminators to kill the signals.
- The BUS is “occupied” by the sender.
 - Two senders resulting in collisions.

Star topology

- Computers are connected via a hub or a switch.
 - Hub sends data to all its interface.
 - switch checks the address of the receiver, and sends out the frame to receiver.

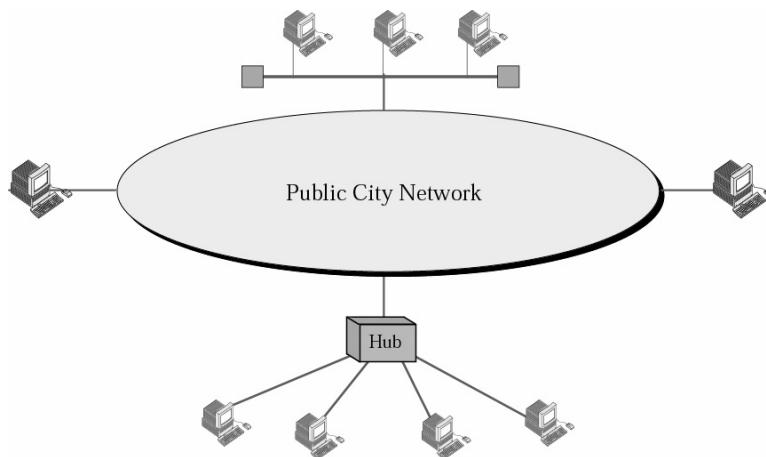

©Brooks/Cole,
2003

Figure 6-5

MAN

Services provided by network service provider like telephone company.

©Brooks/Cole,
2003

Ring Topology

- Computer send a frame to its neighbors.
- The frame is regenerated and sent to its neighbor until it reaches the destination.
- The destination removes the frame and sends ACK back to the sender.
- The sender will remove the ACK when it receive.

2003

Figure 6-6

WAN

ISP: Internet service provider.

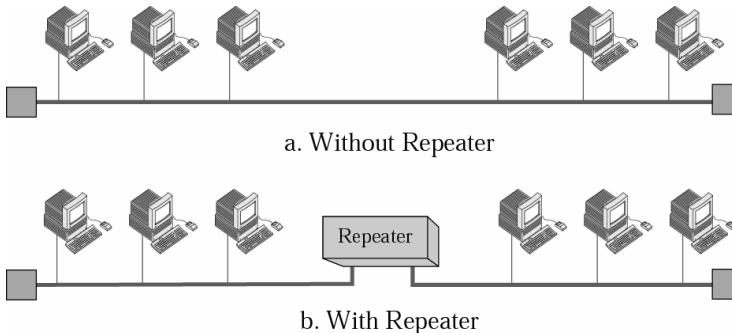

©Brooks/Cole,
2003

6.4

CONNECTING DEVICES

Figure 6-8

Repeater

a. Without Repeater

b. With Repeater

Regenerate signals to extend network length.
Otherwise, signals may become weak.
Operate on the first layer of OSI model.
Usually used in BUS topology.

Figure 6-7

Connecting devices

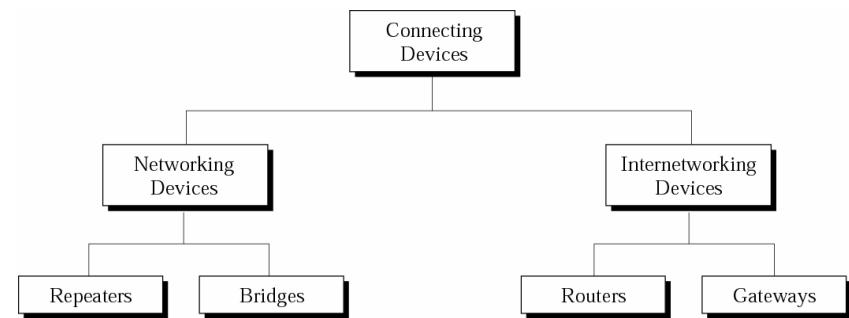

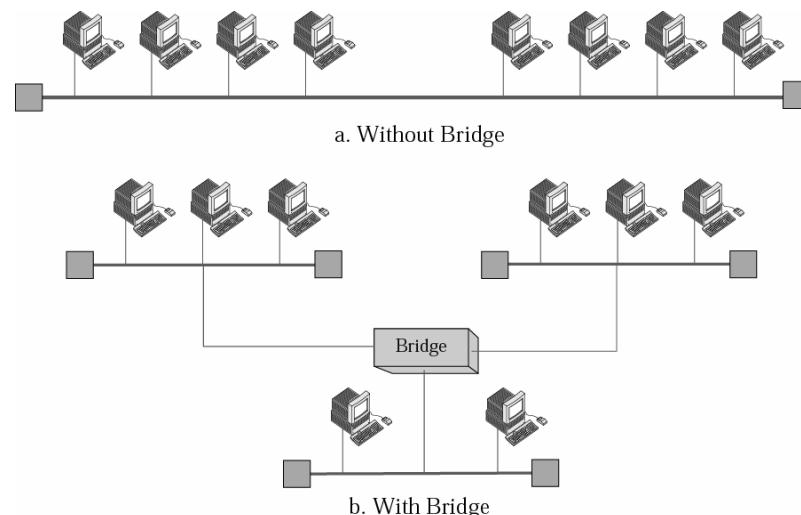

Figure 6-9

Bridge

a. Without Bridge

b. With Bridge

Bridge

- Operate on the second layer of OSI model
- Divide a bus into segments.
- Pass or block frames according to the destination of the frame.
- Two or more computers can communicate at the same time.

Router

- Operate at the first three layers of the OSI model.
- Connect two independent networks
 - Like LAN to WAN
- Router routes packets based on physical address.

Figure 6-10

Switch

Sophisticated bridge with multiple interfaces

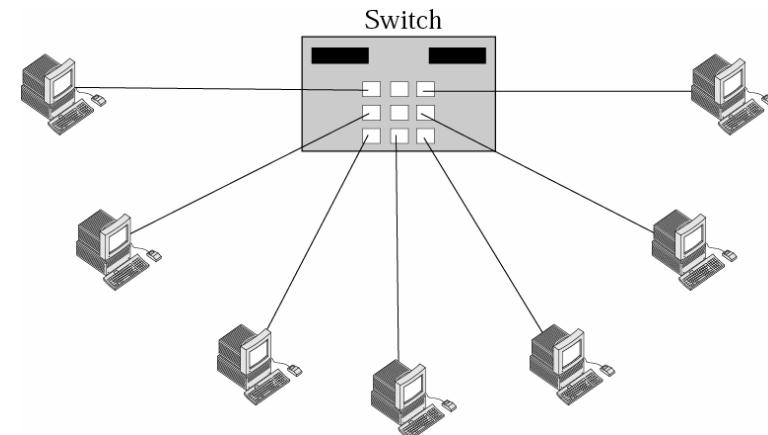

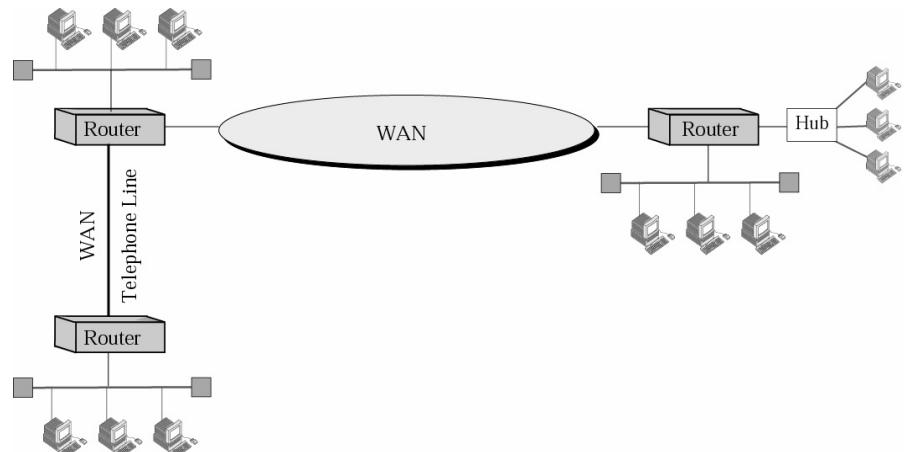

Figure 6-11

Routers in an internet

Gateway

- Act as a protocol converter.
 - Allow two different networks to communicate.
 - Usually a computer with necessary software.
 - The distinction between gateway and router is disappearing.

2003

6.5

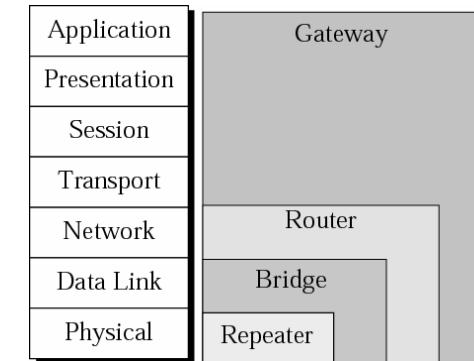

THE INTERNET AND TCP/IP

©Brooks/Cole,
2003

Figure 6-12

Connecting devices and the OSI model

©Brooks/Cole,
2003

Internet

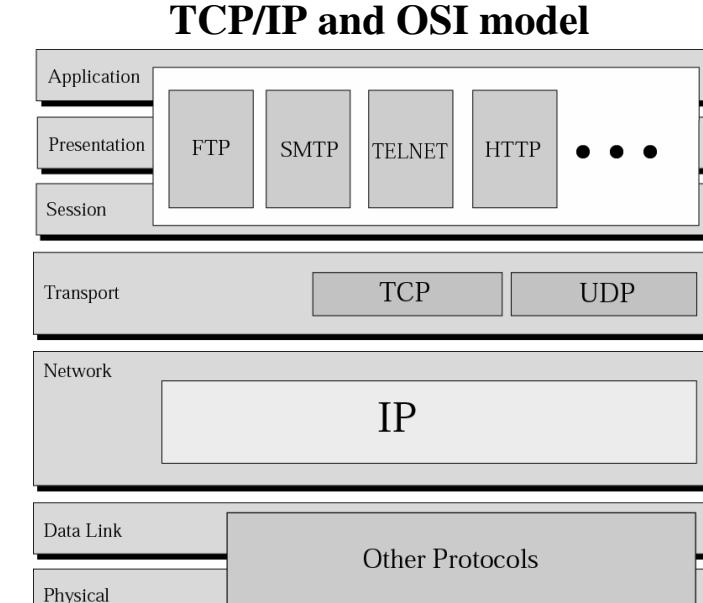

- The most famous internetwork.
- Originally a internetwork research work to connect heterogeneous networks.
- Sponsored by Defense Advanced Research Projects Agency (DARPA)
- Officially Use TCP/IP
 - Transmission Control Protocol/Internet Protocol

©Brooks/Cole,
2003

©Brooks/Cole,
2003

Figure 6-13

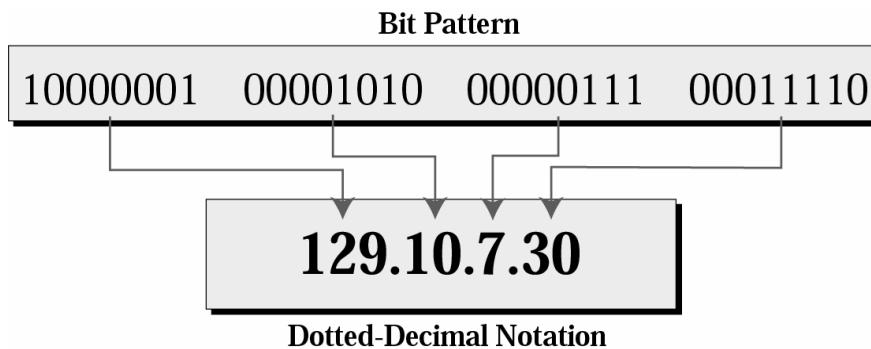

Network Layer

- TCP/IP use IP (internet protocol)
- Data packet in IP layer is called IP datagram.
- Datagram may travel along different routes, lose, arrive out of order.
- IP do not handle the above problems.
- Each device on the Internet is identified by a unique international address (IP address)

Figure 6-14

IP addresses in dotted-decimal notation

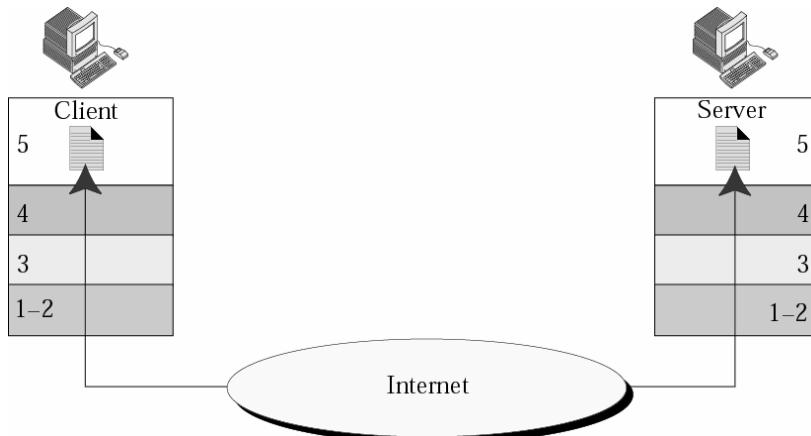

Transport Layer

- TCP/IP defines two protocols:
 - TCP (Transmission Control Protocol)
 - UDP (User Datagram Protocol)
- UDP is simpler
 - Provide the basic necessities for end-to-end delivery.
- TCP provide full transport layer service.
 - Divide message into numbered segments.
 - Resend lost segment
 - Reorder received segments.

Figure 6-15

Client-server model

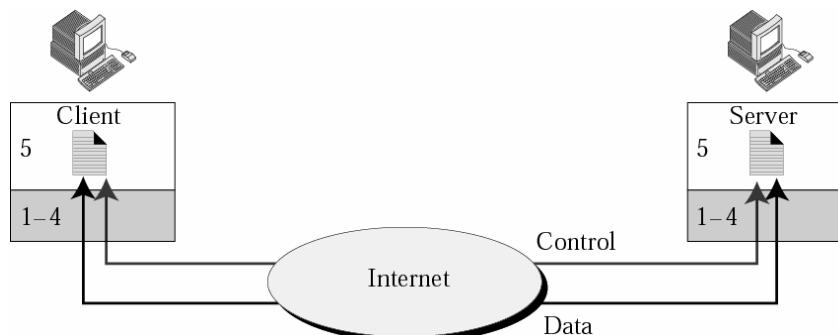

Important Protocols on Internet

- OSI model 5~7.
- FTP (File transfer protocol)
- SMTP (Simple Mail Transfer Protocol)
- POP (Post office protocol)
- TELNET (TERminaL NETwork)
- HTTP (Hypertext transfer protocol)

Figure 6-16

FTP

Can handle:
Different coding methods (ASCII to Unicode)
Different file format.

Figure 6-17

SMTP

Run as needed.

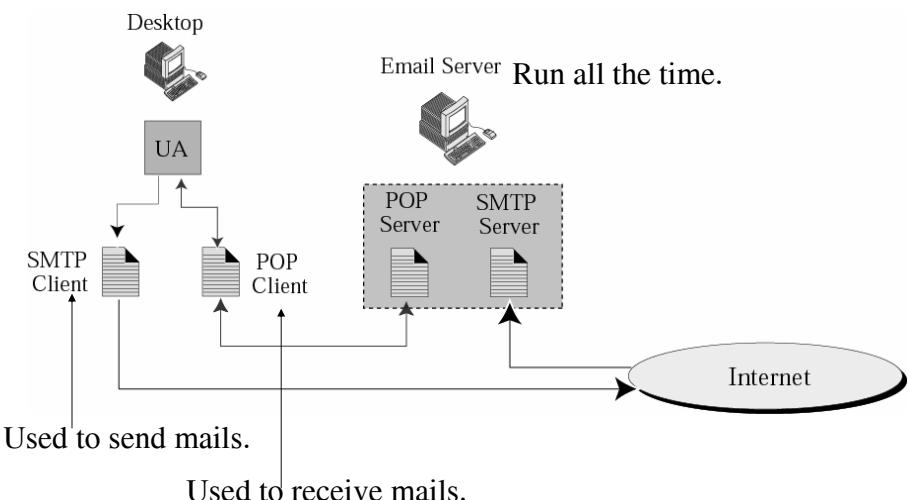

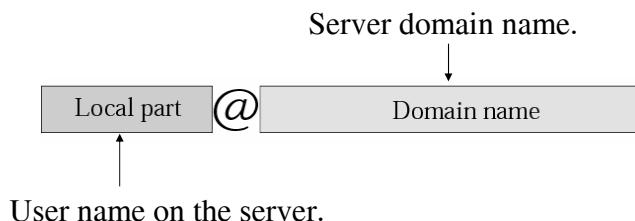

Figure 6-18

Email address

SMTP uses a unique addressing system to address an email box.

©Brooks/Cole,
2003

HTTP

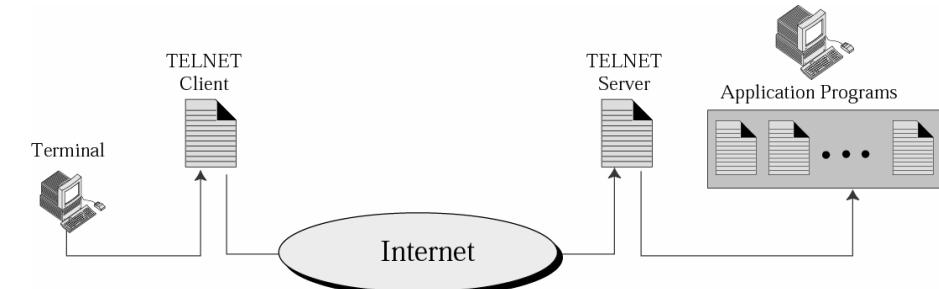

- Hypertext Transfer Protocol
- Allow to transfer documents over WWW – especially hypertext.
- WWW (World Wide Web)
 - Sharing information over Internet.
- Client and server architecture.
 - Use letter-like string to send message.

©Brooks/Cole,
2003

Figure 6-19

TELNET

FTP and SMTP focus on specific services.
 TELNET is a general-purpose client-server program.
 Control remote computer to do something.
 Allow remote login
 Login: Local login/ Remote Login

©Brooks/Cole,
2003

Figure 6-20

URL

Uniform Resource Locator.
 An addressing method used to address a resource.

Like HTTP: Domain name:

`http://directory.google.com:80/Top/World/Chinese_Traditional/`

©Brooks/Cole,
2003

©Brooks/Cole,
2003

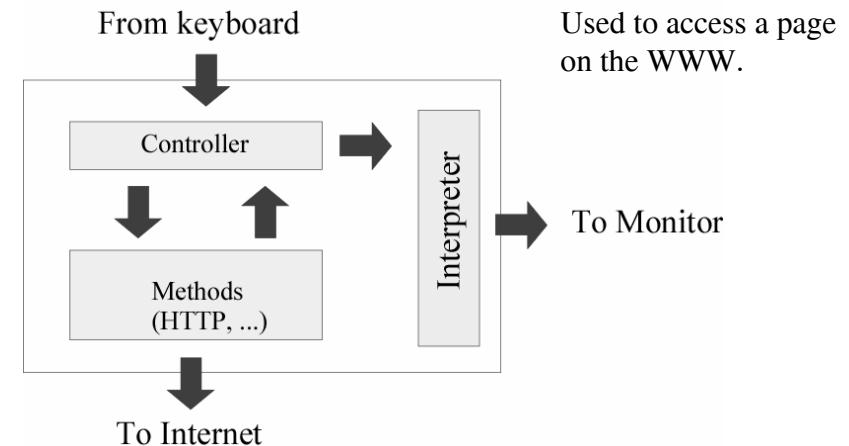

Hypertext

- A document contains special text, words or phrases, that can create a link to other resources.
- A hypertext document: webpage
- The main page of a website: homepage.

```
<html><head><meta http-equiv="content-type" content="text/html; charset=UTF-8"><title>Google</title><style><!--  
body,td,a,p,.h{font-family:arial,sans-serif;}  
.h{font-size: 20px;}  
.a{color:#0000cc;}  
//-->  
</style>  
<script>  
<!--  
Function sf(){document.f.q.focus();}  
function clk(el,ct,cd){if(document.images){(new Image()).src="/url?sa=T&ct="+escape(ct)+"&cd="+escape(cd)+"&url="+  
// -->  
</script>  
</head><body bgcolor="#FFFFFF" text="#000000" link="#0000cc" vlink="#551a8b" alink="#ff0000" onLoad=sf()><center><table cellpadding="0" cellspacing="0" border="0"><tr><td><form action="/search" name=f><script><!--  
function qs(e1) {if (window.RegExp && window.encodeURIComponent) {var qe=encodeURIComponent(document.f.q.value);if  
// -->  
</script><table border="0" cellpadding="4" cellspacing="4"><tr><td nowrap class=q><font size=-1><b><font color="#000000">所  
search?hl=zh-TW>進階搜尋</a><br>&ampnbsp<a href=/preferences?hl=zh-TW>使用偏好</a><br>&ampnbsp<a href=/lan  
的網頁</label></font></td></tr></table></form><p><font size=-1><b><font size=-1><a href=/int1/zh  
<script>  
//-->  
if (hp.isHomePage('http://www.google.com.tw')) {document.write('<p><a href="'+mguhp.html'" onClick="style.behavi  
//-->  
</script></font><p><font size=-1>&copy;2004 Google - 搜尋 4,285,199,774 頁的網頁</font></p></center></body></html>
```

Figure 6-21

Browser

Used to access a page on the WWW.

To Monitor

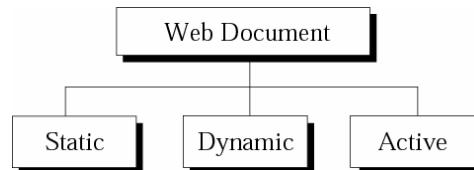

To Internet

©Brooks/Cole,
2003

Figure 6-22

Categories of Web documents

Static documents

- Fixed contents.
- Usually made of Hypertext Markup language.

Dynamic document

- Program runs at the server.
- Browser → Send request → Server → Program → Generate results → A web page → Browser
- Popular Approaches
 - CGI (Common Gateway Interface)
 - Perl
 - PHP
 - ASP

©Brooks/Cole,
2003

Active Programs

- A program runs at the client site.
- Browser → Send request → Server → Send Program → Browser → Execute Program → Generate Results
- Like JAVA.

©Brooks/Cole,
2003
